EULERIAN INTEGRAL FORMULAS AND ASSOCIATED
FRACTIONAL INTEGRATION

MRIDULA GARG AND MRIDULA PUROHIT

Abstract. In the present paper, we evaluate two unified Eulerian integrals whose integrands involve the product of a general class of multivariable polynomials and the multivariable H-function. The results obtained here provide interesting unifications and extensions of several known [eg. [9], [11], [12], [18], [21], etc.] and new results. We have given two new special cases which are also sufficiently general in nature and of interest in themselves. As an application, one of the result has also been expressed as fractional integral which would provide useful generalization of known results in the theory of fractional calculus.

1. Introduction

A large number of Eulerian integrals involving H-function of one or more variables have been established by a number of research workers such as Srivastava and Singh [21], Gupta and Soni [6], Raina and Srivastava [8], Saxena and Nishimoto [11], Srivastava and Hussain [18], Saigo and Raina [9], Garg and Gupta [5] and many others. In the present paper we shall obtain two main Eulerian integrals which provide generalizations of some of the results mentioned above. The integrals obtained here involve product of a general class of multivariable polynomial and the multivariable H-function.

Several generalizations of the multivariable polynomials have been studied by different authors from time to time namely Carlitz and Srivastava [2], Carlitz [1], Chak [3], Erdelyi [4], etc. [see also [21, Ch. 9]]. However, we shall consider here the following two general class of multivariable polynomials

(i) The first class of multivariable polynomials introduced by Srivastava and Garg [16, p. 686, eq. (1.4)] as follows

$$S_{U_1,\ldots,U_r}[x_1,\ldots,x_r] = \sum_{k_1,\ldots,k_r=0}^{U_1 k_1 + \cdots + U_r k_r \leq V} (-V)^{U_1 k_1 + \cdots + U_r k_r} A(V; k_1,\ldots,k_r) \frac{x_1^{k_1}}{k_1!} \cdots \frac{x_r^{k_r}}{k_r!}$$

$$V = 0, 1, 2, \ldots (1.1)$$

Key words and phrases. Eulerian integral, fractional integration, multivariable polynomials, multivariable H-function.

203
where $U_1 \cdots U_r$ are arbitrary positive integers and the coefficient $A(V; k_1, \ldots, k_r)$ are arbitrary constants, real or complex.

(ii) The second general class of multivariable polynomials given by Srivastava [14] defined and represented in the following slightly modified from

$$S_{V_1, \ldots, V_r}^{U_1, \ldots, U_r}[x_1, \ldots, x_r] = \sum_{k_1=0}^{[V_1/U_1]} \cdots \sum_{k_r=0}^{[V_r/U_r]} (-V_1)_{U_1} \cdots (-V_r)_{U_r} \prod_{k=1}^{r} \frac{x_1^{k_1} \cdots x_r^{k_r}}{k_1! \cdots k_r!}$$

(1.2)

where $V_i = 0, 1, 2, \ldots \; [i = 1, \ldots r]$, $U_1, \ldots, U_r$ are arbitrary positive integers, the coefficients $A[V_1, k_1; \ldots; V_r, k_r]$ being arbitrary constants, real or complex.

The multivariable $H$-function, introduced and studied by Srivastava and Panda [20] occurring in this paper will be defined in the following contracted form [17, p. 251], eq. (C.1)]

$$H[x_1, \ldots, x_t] = H^{0,N;M_1,N_1;\ldots;M_t,N_t}_{P,Q,P_1,q_1;\ldots;P_t,Q_t} \left[ \begin{array}{c} x_1 \\ \vdots \\ x_t \\ \end{array} \right] \begin{array}{c} (a_j : a_k^{(1)}, \ldots, a_k^{(t)})_{1,p} : \\
\vdots \\
(b_j : \beta_k^{(1)}, \ldots, \beta_k^{(t)})_{1,q} : \\
(c_k^{(1)}, \gamma_k^{(1)})_{1,p_1} ; \ldots ; (c_k^{(t)}, \gamma_k^{(t)})_{1,p_t} \\
(d_k^{(1)}, \delta_k^{(1)})_{1,q_1} ; \ldots ; (d_k^{(t)}, \delta_k^{(t)})_{1,q_t} \\
\end{array} \right]$$

(1.3)

$$= \frac{1}{(2\pi)^t} \int L_1 \cdots L_t \psi(\xi_1, \ldots, \xi_t) \phi_1(\xi_1) \cdots \phi_t(\xi_t) d^t \xi \cdots d^t \xi$$

where

$$\psi(\xi_1, \ldots, \xi_t) = \prod_{k=N+1}^{N} \Gamma(1 - a_k + \sum_{j=1}^{t} a_k^{(j)} \xi_j)$$

(1.4)

$$\phi_j(\xi) = \prod_{k=1}^{M_j} \Gamma(1 - d_k^{(j)} + \delta_k^{(j)} \xi_j) \prod_{k=1}^{N_j} \Gamma(c_k^{(j)} - \gamma_k^{(j)} \xi_j)$$

(1.5)

For the convergence and existence conditions of the multivariable $H$-function, we refer to the book by Srivastava et al. [17, pp. 251-253, eqs. ((C.2)-(C.8))]. It has been assumed throughout the present work that the function satisfies the above cited conditions.
2. Eulerian Integrals

In this section, we shall obtain the following two integral formulas associated with second class of multivariable polynomials and the multivariable H-function as defined in the previous section.

**First Integral**

\[
\int_a^b (x-a)^{p-1}(b-x)^{q-1}(cx+d)^\eta (gx+f)^\nu S_{V_1,\ldots,V_r}^{U_1,\ldots,U_t} [g_1(x-a)^{\gamma_1}(b-x)^{\delta_1}(cx+d)^{\lambda_1}]
\]

\[
(gx+f)^{\delta_1},\ldots,y_r(x-a)^{\gamma_r}(b-x)^{\delta_r}(cx+d)^{\lambda_r}(gx+f)^{\delta_r} \times H \left[ z_1 \frac{(x-a)^{\rho_1}(b-x)^{\eta_1}}{(cx+d)^{\tau_1}(gx+f)^{\nu_1}},
\right.
\]

\[
\ldots, z_r \frac{(x-a)^{\rho_r}(b-x)^{\eta_r}}{(cx+d)^{\tau_r}(gx+f)^{\nu_r}} \right] \, dx = (b-a)^{p+\sigma-1}(ac+d)^\eta (bg+f)^\nu \]

\[
\sum_{k_1=0}^{[V_1/U_1]} \cdots \sum_{k_r=0}^{[V_r/U_r]} \left( (-V_1)_{U_1} k_1 \cdots (-V_r)_{U_r} k_r A(V_1,k_1;\ldots;V_r,k_r) \prod_{i=1}^r \left( \frac{y_i^{k_i}}{k_i!} \right) \right)
\]

\[
\times (b-a)^{\rho_1 k_1} (ac+d)^{\lambda_1 k_1} (bg+f)^{\delta_1 k_1} \left\{ \prod_{i=1}^r \left( \frac{y_i^{k_i}}{k_i!} \right) \right\} \times H_0^{0,0,1,0,0;1,0,0,1,0;0,0,0}.
\]

\[
\left[ I_1,\ldots,I_t, \frac{(b-a)c}{ac+d}, -\frac{(b-a)g}{bg+f} \right] \left[ A : C; \ldots; -\frac{I_t}{B : D}; (0,1); (0,1) \right]
\]

where

\[
I_j = \frac{z_j(b-a)^{\rho_j+\eta_j}}{(ac+d)^{\tau_j}(bg+f)^{\nu_j}} \quad (j = 1, \ldots, t)
\]

\[
A = (1-\rho-\sum_{i=1}^r \gamma_i k_i ; p_1,\ldots,p_t,1,0), (1-\sigma-\sum_{i=1}^r \delta_i k_i ; q_1,\ldots,q_t,0,1),
\]

\[
(1+\eta+\sum_{i=1}^r \lambda_i k_i ; r_1,\ldots,r_t,1,0), (1+\omega+\sum_{i=1}^r \delta_i k_i ; s_1,\ldots,s_t,0,1),
\]

\[
(a_k, a_k^{(1)}, \ldots, a_k^{(r)} ; 0,0,1) \quad (2.2)
\]

\[
B = (1+\eta+\sum_{i=1}^r \lambda_i k_i ; r_1,\ldots,r_t,0,0), (1+\omega+\sum_{i=1}^r \delta_i k_i ; s_1,\ldots,s_t,0,0),
\]

\[
(1-\rho-\sigma-\sum_{i=1}^r (\gamma_i + \delta_i) k_i ; p_1+q_1,\ldots,p_t+q_t,1,1), (b_k, \beta_k^{(1)}, \ldots, \beta_k^{(r)} ; 0,0,1) \quad (2.3)
\]

\[
C = (c_k^{(1)}, \gamma_k^{(1)} ; p_1,\ldots, c_k^{(r)}, \gamma_k^{(r)} ; 1,1)
\]

\[
D = (d_k^{(1)}, \delta_k^{(1)} ; q_1,\ldots, d_k^{(r)}, \delta_k^{(r)} ; 1,1)
\]

provided that the following conditions are satisfied

(i) \( \text{Re}(\rho, \sigma) > 0 \)
When min \( (\zeta_i, \theta_i) \geq 0 \) (not all zero simultaneously)

\[
\text{Re}[\rho] + \sum_{j=1}^{r} p_j \min_{1 \leq k \leq M_j} \text{Re} \left( \frac{d_k^{(j)}}{\delta_k^{(j)}} \right) > 0
\]

\[
\text{Re}[\sigma] + \sum_{j=1}^{r} q_j \min_{1 \leq k \leq M_j} \text{Re} \left( \frac{d_k^{(j)}}{\delta_k^{(j)}} \right) > 0
\]

When max \( (\zeta_i, \theta_i) < 0 \) (not all zero simultaneously)

\[
\text{Re}[\rho] + \sum_{i=1}^{r} \zeta_i \left[ \frac{V_i}{U_i} \right] + \sum_{j=1}^{t} p_j \min_{1 \leq k \leq M_j} \text{Re} \left( \frac{d_k^{(j)}}{\delta_k^{(j)}} \right) > 0
\]

\[
\text{Re}[\sigma] + \sum_{i=1}^{r} \theta_i \left[ \frac{V_i}{U_i} \right] + \sum_{j=1}^{t} q_j \min_{1 \leq k \leq M_j} \text{Re} \left( \frac{d_k^{(j)}}{\delta_k^{(j)}} \right) > 0
\]

When \( \zeta_i \geq 0, \theta_i < 0 \) (not all zero simultaneously)

(II) and (IV) are satisfied

When \( \theta_i \geq 0, \zeta_i < 0 \) (not all zero simultaneously)

(II) and (III) are satisfied

(iv) \( \max \{ |(b-a)c_j|, |(b-a)d_j| \} < 1; b \neq a \)

Second Integral

\[
\int_a^{b} (x-a)^{\rho-1}(b-x)^{\sigma-1}(cx+d)^\lambda (gx+f)^\eta \cdot y_1(x-a)^{c_1}(b-x)^{d_1} \cdot (cx+d)^{e_1}(gx+f)^{f_1} \times H^* \left[ \frac{(cx+d)^{e_1}(gx+f)^{f_1}}{(x-a)^{b_1}(b-x)^{d_1}} \right]
\]

\[
\times \prod_{V_i, U_i} \left[ \frac{V_i}{U_i} \right] \sum_{k_i=0}^{\lambda_k} \ldots \sum_{k_i=0}^{\lambda_k} \left[ \sum \left( \frac{y_i}{k_i!} (b-a)(\zeta_i + \theta_i)k_i \right) \right] \times H^{0.4 N_1 M_1; \ldots; N_t M_t}_{0.1.0.1.0} \]

\[
\left[ J_1, \ldots, J_r, c \frac{(b-a)}{ac+d}, -g(b-a) \right] \left[ A^* : C^*; -; - \right] \left[ B^* : D^*, (0,1); (0,1) \right]
\]

where

\[
H^*[z_1, \ldots, z_t] \text{ stands for } H[z_1, \ldots, z_t] \text{ with } N = 0.
\]

\[
J_j = \frac{1}{z_j (ac+d)^{\rho_j+q_j}} \quad (j = 1, \ldots, t)
\]
When min
\[ (\text{V}) \]
and
\[ (\text{VI}) \]
provided that the following conditions are satisfied

(i) \( \text{Re}(\rho, \sigma) > 0 \)

(ii) \( \min(p_j, q_j, r_j, s_j) \geq 0 \) \( (j = 1, \ldots, t) \) (not all zero simultaneously)

(iii) When \( \min(\zeta_i, \theta_i) \geq 0 \) \( (i = 1, \ldots, r) \)

\[ \text{Re}[\rho] + \sum_{j=1}^{t} p_j \min_{1 \leq k \leq N_j} \text{Re} \left( \frac{c_j^{(1)} - 1}{\gamma_k^{(1)}} \right) > 0 \]  
\[ \text{Re}[\sigma] - \sum_{j=1}^{t} q_j \max_{1 \leq k \leq N_j} \text{Re} \left( \frac{c_j^{(1)} - 1}{\gamma_k^{(1)}} \right) > 0 \]

When max \( (\zeta_i, \theta_i) < 0 \) \( (i = 1, \ldots, r) \)

\[ \text{Re}[\rho] + \sum_{i=1}^{r} \zeta_i \left[ \frac{V_i}{U_i} \right] + \sum_{j=1}^{t} p_j \max_{1 \leq k \leq N_j} \text{Re} \left( \frac{c_k^{(1)} - 1}{\gamma_k^{(1)}} \right) > 0 \]  
\[ \text{Re}[\sigma] + \sum_{i=1}^{r} \theta_i \left[ \frac{V_i}{U_i} \right] - \sum_{j=1}^{t} q_j \max_{1 \leq k \leq N_j} \text{Re} \left( \frac{c_k^{(1)} - 1}{\gamma_k^{(1)}} \right) > 0 \]

When \( \zeta_i \geq 0, \theta_i < 0, (i = 1, \ldots, r) \), (V) and (VIII) are satisfied

When \( \theta_i \geq 0, \zeta_i < 0, (i = 1, \ldots, r) \), (VI) and (VII) are satisfied

(iv) \( \max\{\frac{(b-a)c}{ac+|d|}, \frac{(b-a)d}{bd+|a|}\} < 1; b \neq a \)

**Proof.** To establish the integral given by (2.1), we first express the multivariable H-function and the second class of multivariable polynomial occurring in the left hand side of (2.1) with the help of (1.3) and (1.2) respectively, then collect the powers of \((cx + d)\)
and \((gx + f)\) and apply the following binomial expansions for \(x \in [a, b]\)

\[(cx + d)^n = (ac + d)^n \sum_{l_1=0}^{\infty} \frac{(-\eta)l_1}{l_1!} \left(\frac{-(x-a)c}{ac+d}\right)^{l_1}, \mid(x-a)c\mid < \mid ac+d\mid \quad (2.13)\]

\[(gx + f)^\omega = (bg + f)^\omega \sum_{l_2=0}^{\infty} \frac{(-\omega)l_2}{l_2!} \left(\frac{+(x-b)g}{bg+f}\right)^{l_2}, \mid(x-b)g\mid < \mid bg+f\mid \quad (2.14)\]

with \(\eta\) and \(\omega\) replaced by \(\eta + \sum_{i=1}^{t} \lambda_i k_i - \sum_{j=1}^{s} r_j \xi_j\) and \(\omega + \sum_{i=1}^{r} \delta_i k_i - \sum_{j=1}^{t} s_j \xi_j\) respectively. Here \(\xi_1, \ldots, \xi_t\) denote the variables of the aforementioned Mellin Barnes contour integral as an \(H\)-function. Finally, making use of well known Eulerian integral

\[\int_{a}^{b} (x-a)^{\rho-1}(x-b)^{\sigma-1} dx = (b-a)^{\rho+\sigma-1}B(\rho, \sigma); \text{Re}(\rho) > 0, \text{Re}(\sigma) > 0; b \neq a\]

and interpreting the resulting Mellin Barnes contour integral as an \(H\)-function of \((t+2)\) variables, we arrive at the right hand side of (2.1) after a little simplification. To prove the second integral given by (2.7), we follow the same lines as in the proof of (2.1) except the following changes. Here, we apply the binomial expansions (2.13) and (2.14) with \(\eta\) and \(\omega\) replaced by \(\eta + \sum_{i=1}^{t} \lambda_i k_i + \sum_{j=1}^{s} r_j \xi_j\) and \(\omega + \sum_{i=1}^{r} \delta_i k_i + \sum_{j=1}^{t} s_j \xi_j\) respectively and then set \(\xi_j = -\zeta_j(j = 1, \ldots, t)\) to interpret the resulting Mellin Barnes contour integral as an \(H\)-function of \((t+2)\) variables and arrive at right hand side of (2.7).

Two more integral formulas, involving the product of first class of multivariable polynomials \(S_{V}^{U_1,\ldots,U_r}[x_1,\ldots,x_r]\) and the multivariable \(H\)-function, can also be obtained similarly. However, we omit the details here.

3. Special Cases

Each of our integral formulas (2.1) and (2.7) possesses manifold generality. The multivariable \(H\)-function occurring in these results can be suitably specialized to yield a wide variety of special functions (or product of such functions) of one or more variables [17, pp. 18-19, 88-93, 253-254]. Again by suitably specializing the coefficient of the general class of multivariable polynomials it can be reduced to other multivariable hypergeometric polynomials and classical orthogonal polynomials of one or more variables.

Thus our results and their several variations (obtained by letting any desired number of exponents \(\{\zeta_i, \theta_i, \lambda_i, \delta_i, p_j, q_j, r_j, s_j;i = 1, \ldots, r; j = 1, \ldots, t\}\) tend to zero in such a manner that each side of resulting equation has a meaning) would yield the corresponding results involving a large number of simpler functions and polynomials.

To illustrate we now obtain some new special cases of our result (2.1) and also give references to several known results which follow as special cases of integral formulas (2.1) and (2.7).

(i) On taking \(A(V_1, k_1; \ldots; V_r, k_r) = A_1(V_1, k_1) \cdots A_r(V_r, k_r)\) in (2.1), the multivariable polynomial \(S_{V_1,\ldots,V_r}[x_1,\ldots,x_r]\) reduces to the product of \(r\) well known general class
of polynomial \( S_{V_i}^{(r)}[x] \) introduced by Srivastava [[13, p.1, eq. (1)]]; for more details see [21]] and the result assumes the following form

### Third Integral

\[
\int_a^b (x-a)^{p-1}(b-x)^{q-1}(cx+d)^\omega (gx+f)^\xi H \left[ \frac{(x-a)^{p_1}(b-x)^{q_1}}{(cx+d)^{\omega_1}(gx+f)^{\xi_1}}, \ldots, \frac{(x-a)^{p_r}(b-x)^{q_r}}{(cx+d)^{\omega_r}(gx+f)^{\xi_r}} \right] dx
\]

\[
= (b-a)^{p+q-1}(ac+d)^\omega (bg+f)^\xi \prod_{i=1}^r \sum_{k_i=0}^{[V_i/U_i]} (-1)^{V_i-k_i} A_i(V_i, k_i) \frac{y_i^{k_i}}{k_i!}
\]

where the \( H \)-function occurring in the right hand side of (3.1) is same as in right hand side of (2.1) and the conditions mentioned with (2.1) are assumed to be satisfied.

(ii) On taking

\[
A(V_1, k_1; \ldots; V_r, k_r) = \frac{\prod_{i=1}^r (a_i)^{\phi_i^{(1)}} b_i^{\phi_i^{(2)}} \cdots \phi_i^{(r)}}{\prod_{i=1}^r b_i^{\phi_i^{(1)}} b_i^{\phi_i^{(2)}} \cdots \phi_i^{(r)}}
\]

in (2.1), \( S_{V_1, \ldots, V_r}^{(r)}[x_1, \ldots, x_r] \) reduces to the polynomial form of the generalized Lauricella function of Srivastava and Daoust [15, p. 545] as follows

\[
S_{V_1, \ldots, V_r}^{(r)}[x_1, \ldots, x_r] = \sum_{(a_1, \ldots, a_r) \in A'} \prod_{i=1}^r (a_i)^{\phi_i^{(1)}} b_i^{\phi_i^{(2)}} \cdots \phi_i^{(r)}
\]

and we easily arrive at an Eulerian integral involving product of general Lauricella function and the multivariable \( H \)-function. We however, omit the details of the result due to lack of space.

(iii) On taking \( A(V_1, k_1; \ldots; V_r, k_r) = \frac{(a_1+1)^{V_1} \cdots (a_r+1)^{V_r}}{V_1! \cdots V_r!} \times \prod_{i=1}^r (\alpha+1)^{k_i} \) (\( \mu \) being arbitrary) and \( U_i = 1(i = 1, \ldots, r) \) in (2.1), \( S_{V_1, \ldots, V_r}^{(r)}[x_1, \ldots, x_r] \) reduces to the polynomials \( L_{V_1, \ldots, V_r}^{\mu}[x_1, \ldots, x_r] \) which are an extension, due to Chak [3, p.14, eq.(1.1)], of the generalized Laguerre polynomials in several variables studied by Erdélyi [4] and the result (2.1) assumes the following form

\[
L_{V_1, \ldots, V_r}^{\mu}[x_1, \ldots, x_r] = \frac{\prod_{i=1}^r (a_i)^{V_i} b_i^{V_i} \cdots V_i^{V_i}}{V_i!} \times \prod_{i=1}^r (\alpha+1)^{k_i} \mu \]
Fourth Integral

\[
\int_a^b (x-a)^{p-1}(b-x)^{\sigma-1}(cx+d)^\eta(gx+f)^\omega L_{V_1,\ldots, V_r}^{\alpha_\mu}[y_1(x-a)^{\lambda_1}(b-x)^{\lambda_2}(cx+d)^{\lambda_3}]
\]

\[
\sum_{i=0}^{V_1} \cdots \sum_{k_r=0}^{V_r} (-V_1)_{k_1} \cdots (-V_r)_{k_r} \prod_{i=1}^{r} \left( \frac{y_{k_i}}{k_i!} \right) \frac{(a-b)^{\omega+\sigma-1}(ac+d)^\eta(bg+f)^\omega}{V_1! \cdots V_r!}
\]

\[
\times H \left[ I_1, \ldots, I_t, \frac{(b-a)c}{ac+d}, \frac{(b-a)g}{bg+f} \right]
\]

where \( H \)-function occurring in the right hand side of (3.4) is same as in right hand side of (2.1) and the conditions of validity of (3.4) can easily be obtained from those stated with (2.1).

(iv) If in integral formulas (2.1) and (2.7) we take \( V_i = 0 \) \((i = 1, \ldots, r)\), reduce the multivariable polynomials to unity and further take \( p_j = q_j = 0 \) \((j = 1, \ldots, t)\), we arrive at the integral evaluated recently by Srivastava and Hussain [18, p. 79, eqs. (2.5), (2.6)] after a little simplification.

In the results thus obtained if we further take \( \omega = 0, s_j = 0 \) \((j = 1, \ldots, t)\) and reduce the multivariable \( H \)-function to product of 't' Fox's \( H \)-function (by taking \( N = P = Q = 0 \)), then on taking \( t = 1 \), we arrive at the integrals evaluated recently by Saxena and Nishimoto [11, p. 69, eq. (4.1)].

(v) On taking \( V_i = 0 \) \((i = 1, \ldots, r)\) in (2.1) and reducing the general class of multivariable polynomials to unity. Further, on taking \( \omega = 0, s_j = 0 \) \((j = 1, \ldots, t)\) and reducing the multivariable \( H \)-function to product of 't' Fox's \( H \)-function (by taking \( N = P = Q = 0 \)), then on taking \( t = 1 \), we arrive at the integral evaluated recently by Saxena and Saigo [12, p. 37, eq. (2.1)].

(vi) If we take \( r = 1 \) in (2.1), the general class of multivariable polynomials reduces to \( S_U^V(x) \), and further on taking \( \theta = 1, \zeta = \lambda = \delta = 0, r_j = s_j = 0 \) \((j = 1, \ldots, t)\) therein, we easily arrive at an integral evaluated earlier by Srivastava and Raina [9, eq. (2.1)].

(vii) Next on reducing the \( H \)-function occurring in the left hand side of (2.1) to unity, and setting \( \eta = -\rho - \sigma, c = \lambda - \mu, d = (1+\mu)b-(1+\lambda)a \) and \( \lambda_1 = \delta_1 = 0, \zeta_1 = 1, \theta_i = -1(i = 1, \ldots, r) \) therein, we arrive at the result recently obtained by Saigo and Raina [9, eq. (2.1)].
4. Applications

Each of the Eulerian integrals obtained in previous sections can be expressed as fractional integrals involving the operator \( aD_z^{-\nu} \) defined by \( \text{[see [7], [10]]} \)

\[
aD_z^{-\nu}[f(z)] = \frac{1}{\Gamma(\nu)} \int_a^z (z-t)^{\nu-1} f(t)dt; \quad \text{Re}(\nu) > 0 \quad (4.1)
\]

when \( a = 0 \), the fractional integral operator (4.1) corresponds to the classical Riemann-Liouville fractional integral of order \( \nu \). Moreover, when \( a \to \infty \), equation may be identified with the definition of Weyl fractional integral of order \( \nu \). Thus for example, for \( b = z, \theta_i = 0 = q_j \) (\( i = 1, \ldots, r; j = 1, \ldots, t \)), we express below the integral (2.1) as fractional integral formula which is valid under the conditions easily obtained from those state with (2.1)

\[
aD_z^{-\sigma}\left\{ (z-a)^{\nu-1}(cz+d)^{\alpha}(gz+f)^{\beta} \right\} \times S_{V_1, \ldots, V_r} \left| y_1(z-a)^{\nu-1}(cz+d)^{\alpha_1}(gz+f)^{\beta_1}, \ldots, y_r(z-a)^{\nu-1}(cz+d)^{\alpha_r}(gz+f)^{\beta_r} \right| \times H \left[ \frac{(z-a)^{\nu}}{(cz+d)^{\alpha}(gz+f)^{\beta}} \right] = \frac{1}{\Gamma(\sigma)} (z-a)^{\nu+\sigma-1}(ac+d)^{\eta}
\]

\[
(z+f)^{\omega} \sum_{k_1=0}^{\infty} \cdots \sum_{k_r=0}^{\infty} (-V_1)_{U_1,k_1} \cdots (-V_r)_{U_r,k_r} \times A(V_1, k_1; \ldots; V_r, k_r)
\]

\[
\prod_{i=1}^{r} \frac{y_i}{k_i} (b-a)^{\alpha_i}(ac+d)^{\alpha_i}(gz+f)^{\beta_i} \right\} \times H_{F, Q}^{0, N+3, M_1, N_1; \ldots; M_r, N_r, 0, 0, 1, 1}
\]

\[
K_1, \ldots, K_r, \left\{ c(z-a)(ac+d) \right\} \times A^{**} : C; \left\{ 1, -(1, \sigma, 1) \right\} B^{**} : D; (0, 1); (0, 1)
\]

(4.2)

where \( K_j \) stands for \( I_j \) as given by (2.2) with \( q_j = 0 \) (\( j = 1, \ldots, t \)), \( C \) and \( D \) are given by (2.5) and (2.6) respectively.

\[
A^{**} = (1 + \eta + \sum_{i=1}^{r} \lambda_i k_i; r_1, \ldots, r_t, 1, 0), (1 + \omega + \sum_{i=1}^{r} \delta_i k_i; s_1, \ldots, s_t, 0, 1),
\]

\[
(1 - \rho - \sum_{i=1}^{r} \zeta_i k_i; p_1, \ldots, p_t, 1, 0), (a_k; a_k^{(l)}, \ldots, a_k^{(t)}, 0, 1)_{1, p}
\]

(4.3)

\[
B^{**} = (1 + \eta + \sum_{i=1}^{r} \lambda_i k_i; r_1, \ldots, r_t, 0, 0), (1 + \omega + \sum_{i=1}^{r} \delta_i k_i; s_1, \ldots, s_t, 0, 0),
\]

\[
(1 - \rho - \sigma - \sum_{i=1}^{r} \zeta_i k_i; p_1, \ldots, p_t, 1, 1), (b_k; \beta_k^{(l)}, \ldots, \beta_k^{(t)}, 0, 0)_{1, Q}
\]
