

Addendum to: Solving an inverse problem for the Sturm-Liouville operator with singular potential by Yurko's method (Tamkang J. Math. 52 (2021), no. 1, 125-154)

Maria A. Kuznetsova and Natalia P. Bondarenko

Abstract. This addendum outlines a simpler proof of Theorem 2.1 from [N.P. Bondarenko, Tamkang J. Math. 52(1), 125-154 (2021)].

Keywords. transformation operator, singular potentials, integral equations

The proof of Theorem 2.1 can be simplified. Specifically, the mappings $I_{\mathcal{K}}(\mathcal{K}, \mathcal{N}, \mathcal{C})$, $I_{\mathcal{N}}(\mathcal{K}, \mathcal{N}, \mathcal{C})$, and $I_{\mathcal{C}}(\mathcal{K}, \mathcal{C})$, which are defined on pages 129–130, can be represented as follows:

$$\begin{aligned}
 I_{\mathcal{K}}(\mathcal{K}, \mathcal{N}, \mathcal{C}) &= \frac{1}{2} \int_{x-t}^x (\mathcal{K}(s, t-x+s) + \mathcal{N}(s, t-x+s)) \sigma(s) ds \\
 &\quad + \frac{1}{2} \int_{\frac{x-t}{2}}^{x-t} (\mathcal{K}(s, x-s-t) - \mathcal{N}(s, x-s-t)) \sigma(s) ds \\
 &\quad + \frac{1}{2} \int_{\frac{x+t}{2}}^x (\mathcal{K}(s, x-s+t) - \mathcal{N}(s, x-s+t)) \sigma(s) ds \\
 &\quad - \frac{1}{2} \int_t^x d\xi \left(\int_{x-\xi}^x \mathcal{K}(s, \xi-x+s) \sigma^2(s) ds \right. \\
 &\quad \left. + \int_{\frac{x-\xi}{2}}^{x-\xi} \mathcal{K}(s, x-s-\xi) \sigma^2(s) ds \right. \\
 &\quad \left. - \int_{\frac{x+\xi}{2}}^x \mathcal{K}(s, x-s+\xi) \sigma^2(s) ds \right) - \int_0^{x-t} \mathcal{C}(s) \sigma(s) ds, \tag{0.1} \\
 I_{\mathcal{N}}(\mathcal{K}, \mathcal{N}, \mathcal{C}) &= -\frac{1}{2} \int_{x-t}^x (\mathcal{K}(s, t-x+s) + \mathcal{N}(s, t-x+s)) \sigma(s) ds \\
 &\quad - \frac{1}{2} \int_{\frac{x-t}{2}}^{x-t} (\mathcal{K}(s, x-s-t) - \mathcal{N}(s, x-s-t)) \sigma(s) ds \\
 &\quad + \frac{1}{2} \int_{\frac{x+t}{2}}^x (\mathcal{K}(s, x-s+t) - \mathcal{N}(s, x-s+t)) \sigma(s) ds \\
 &\quad + \frac{1}{2} \int_t^x d\xi \left(\int_{x-\xi}^x \mathcal{K}(s, \xi-x+s) \sigma^2(s) ds \right)
 \end{aligned}$$

$$\begin{aligned}
& + \int_{\frac{x-\xi}{2}}^{x-\xi} \mathcal{K}(s, x-s-\xi) \sigma^2(s) ds \\
& + \int_{\frac{x+\xi}{2}}^x \mathcal{K}(s, x-s+\xi) \sigma^2(s) ds \Big) + \int_0^{x-t} \mathcal{C}(s) \sigma(s) ds,
\end{aligned} \tag{0.2}$$

$$\begin{aligned}
I_{\mathcal{C}}(\mathcal{K}, \mathcal{C}) = & -\frac{1}{2} \int_0^x d\xi \left(\int_{x-\xi}^x \mathcal{K}(s, \xi-x+s) \sigma^2(s) ds \right. \\
& + \int_{\frac{x-\xi}{2}}^{x-\xi} \mathcal{K}(s, x-s-\xi) \sigma^2(s) ds \\
& \left. + \int_{\frac{x+\xi}{2}}^x \mathcal{K}(s, x-s+\xi) \sigma^2(s) ds \right) - \int_0^x \mathcal{C}(s) \sigma(s) ds.
\end{aligned} \tag{0.3}$$

Using these representations, we get that, for $n \geq 1$, the functions $\mathcal{K}_n(x, t)$, $\mathcal{N}_n(x, t)$, and $\mathcal{C}_n(x)$ are continuous for $0 \leq t \leq x \leq \pi$ and $0 \leq x \leq \pi$, respectively. Moreover, they fulfill the estimates

$$|\mathcal{K}_n(x, t)|, |\mathcal{N}_n(x, t)|, |\mathcal{C}_n(x)| \leq a^n Q^n(x) \sqrt{\frac{x^{n-1}}{(n-1)!}}, \quad n \geq 1, \tag{0.4}$$

with some constant a depending on $\|\sigma\|_{L_2(0, \pi)}$. This immediately implies that the series

$$\sum_{n=1}^{\infty} \mathcal{K}_n(x, t), \quad \sum_{n=1}^{\infty} \mathcal{N}_n(x, t) \quad (\text{without } n=0), \quad \sum_{n=0}^{\infty} \mathcal{C}_n(x)$$

converge absolutely and uniformly to continuous functions. Adding the terms $\mathcal{K}_0(x, t)$ and $\mathcal{N}_0(x, t)$, which belong to $L_2(\mathbb{D})$, one can conclude the proof.

Note that the integrals $\int_{x-\xi}^x \mathcal{K}(s, \xi-x+s) \sigma^2(s) ds$, $\int_{\frac{x-\xi}{2}}^{x-\xi} \mathcal{K}(s, x-s-\xi) \sigma^2(s) ds$, and $\int_{\frac{x+\xi}{2}}^x \mathcal{K}(s, x-s+\xi) \sigma^2(s) ds$ in the formulas (0.1), (0.2), (0.3) are understood as L_1 -functions of ξ for each fixed x . One can change the order of integration to obtain inner integrals that converge absolutely for any fixed x, t, s :

$$\begin{aligned}
I_{\mathcal{K}}(\mathcal{K}, \mathcal{N}, \mathcal{C}) = & \frac{1}{2} \int_{x-t}^x (\mathcal{K}(s, t-x+s) + \mathcal{N}(s, t-x+s)) \sigma(s) ds \\
& + \frac{1}{2} \int_{\frac{x-t}{2}}^{x-t} (\mathcal{K}(s, x-s-t) - \mathcal{N}(s, x-s-t)) \sigma(s) ds \\
& + \frac{1}{2} \int_{\frac{x+t}{2}}^x (\mathcal{K}(s, x-s+t) - \mathcal{N}(s, x-s+t)) \sigma(s) ds \\
& - \frac{1}{2} \left(\int_0^x \sigma^2(s) ds \int_0^{\min\{s, x-t\}} \mathcal{K}(s, s-\xi) d\xi \right. \\
& + \int_0^{x-t} \sigma^2(s) ds \int_s^{\min\{2s, x-t\}} \mathcal{K}(s, \xi-s) d\xi \\
& \left. - \int_{\frac{x+t}{2}}^x \sigma^2(s) ds \int_t^{2s-x} \mathcal{K}(s, x+\xi-s) d\xi \right) - \int_0^{x-t} \mathcal{C}(s) \sigma(s) ds, \\
I_{\mathcal{N}}(\mathcal{K}, \mathcal{N}, \mathcal{C}) = & -\frac{1}{2} \int_{x-t}^x (\mathcal{K}(s, t-x+s) + \mathcal{N}(s, t-x+s)) \sigma(s) ds \\
& - \frac{1}{2} \int_{\frac{x-t}{2}}^{x-t} (\mathcal{K}(s, x-s-t) - \mathcal{N}(s, x-s-t)) \sigma(s) ds
\end{aligned}$$

$$\begin{aligned}
& + \frac{1}{2} \int_{\frac{x+t}{2}}^x (\mathcal{K}(s, x-s+t) - \mathcal{N}(s, x-s+t)) \sigma(s) ds \\
& + \frac{1}{2} \left(\int_0^x \sigma^2(s) ds \int_0^{\min\{s, x-t\}} \mathcal{K}(s, s-\xi) d\xi \right. \\
& + \int_0^{x-t} \sigma^2(s) ds \int_s^{\min\{2s, x-t\}} \mathcal{K}(s, \xi-s) d\xi \\
& \left. + \int_{\frac{x+t}{2}}^x \sigma^2(s) ds \int_t^{2s-x} \mathcal{K}(s, x+\xi-s) d\xi \right) + \int_0^{x-t} \mathcal{C}(s) \sigma(s) ds, \\
I_{\mathcal{C}}(\mathcal{K}, \mathcal{C}) & = -\frac{1}{2} \int_0^x \sigma^2(t) dt \left(\int_{x-t}^x \mathcal{K}(t, \xi-x+t) d\xi + \int_{x-2t}^{x-t} \mathcal{K}(t, x-\xi-t) d\xi \right) \\
& - \int_0^x \mathcal{C}(s) \sigma(s) ds.
\end{aligned}$$

Usage of these relations leads to the same estimates (0.4).
